

# Opening Access to Environmental Software Systems

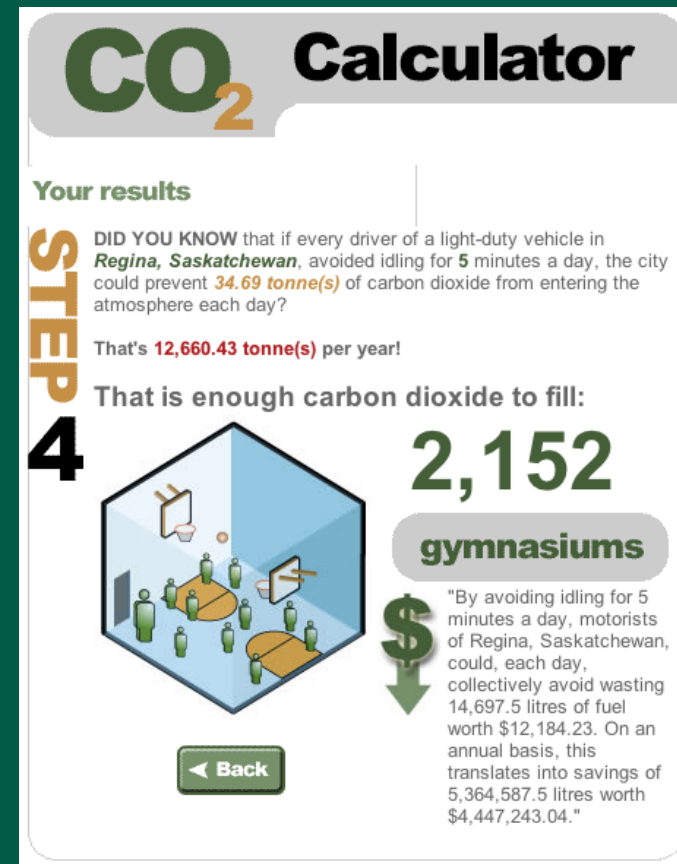

Daryl H. Hepting and Timothy Maciag  
{dhh,maciagt}@cs.uregina.ca  
University of Regina, Regina, SK, Canada

# Motivation

- Three different user types of ESS (Rizzoli and Young, 1997):
  - scientists
  - managers
  - stakeholders
- Focus on stakeholders
  - increase level of discourse
  - their insights inform activities of other types

# Motivation

- Idling calculator (from NRCan website)
  - impact of single cars?
- MSDS (Material Safety Data Sheets)
  - easy to find?
- VOCs
  - smog contributor?
  - carcinogen?

# Issues

- Raskin (2000):
  - never make the user do more work than absolutely necessary
  - novice / expert: dichotomy or continuum?
- How to integrate information?
- How to smooth transitions between novice and expert (and back again)?

# Example: Cleaning Products

- US EPA Environmentally Preferable Purchasing program established purchasing decision wizards: SART, MART, WART
- Related 29 products on 8 attributes:
  - *skin irritation, food chain exposure, air pollution potential, contains fragrance, contains dyes, product is a concentrate (reduced packaging), packaging contains recycled paper, product minimizes exposure to concentrate*
- Not all the attributes were well-understood

Environmentally Preferable Purchasing – Cleaning Products Pilot Project – Weighted Attribute Ranking Tool

US EPA <http://www.epa.gov/opptintr/epp/cleaners/select/tool3/tool3frm.htm> epa epp matrix

**Step 1:** Select the minimum acceptable level for one of the [environmental attributes](#).

**Step 2:** For the same attribute, specify a value between 0 and 1,000 that reflects its relative importance to you. The more important, the higher a value you should select. The value you enter is counted towards a product's total score, provided the product meets the attribute's acceptable level (set in Step 1). Products that do not meet this level will not receive a score for the particular attribute.

**Step 3:** Repeat Steps 1 and 2 for each environmental attribute.

Environmental Attribute	Acceptable Level (Default = most stringent)	Relative Importance (0 to 1,000)
<a href="#">Skin Irritation:</a>	Negligible	0
<a href="#">Food Chain Exposure - BCF:</a>	Minimal	0
<a href="#">Air Pollution Potential - % VOC:</a>	0 %	0
<a href="#">Contains Fragrance:</a>	No	0
<a href="#">Contains Dyes:</a>	No	0
<a href="#">Product Is A Concentrate (Reduced Packaging):</a>	Yes	0
<a href="#">Packaging Contains Recycled Paper:</a>	Yes	0
<a href="#">Product Minimizes Exposure to Concentrate:</a>	Yes	0

For help with determining acceptable values click on the attribute's name.  
Use your browser's "Back" button to return to this page.

**Step 4:** Submit your request.

Submit Reset

# Choosing a Product

- Ranked list
- Faceted classification (Yee et al., 2003)
- Example-based (Pu and Chen, 2005)
- Participants tested with ranked list and example-based approaches, on questions involving 1, 2, and 3 attributes

# At the Interface

- EPA Wizards present these choices for VOC:  $< 1\%$ ,  $< 5\%$ ,  $< 10\%$ ,  $< 20\%$ ,  $< 35\%$ , and  $\geq 35\%$
- Better choices based on data:  $\leq 2\%$ ,  $\leq 6\%$ ,  $\leq 11\%$ ,  $\leq 15\%$   $\leq 35\%$
- Expressiveness: single value or range (threshold)

# Performance Results

- Participants did better on faceted query specification (example-based features not used in this study)
- Difference was observed for 1, 2, and 3 attributes

The screenshot shows a 'New Space' dialog box with eight columns, each representing a different attribute. Each column has a list of options, with some options highlighted in blue. The columns and their options are:

Skin_Irritation	Food_Chain	Air_Pollution	Contains_Fragrance	Contains_Dye	Concentrate	Recyclable_Packaging	Min_Concentrate_Exposure
Exempt	0 (Exempt)	0% (N/A)	No	No	Yes	N/A	N/A
Negligible-Slight	5000 - 9999	0.1% - 1%	Yes	Yes	No	Yes	Yes
Slight	10000 - 15000	1% - 4.9%					No/Small Sizes
Medium	Not Reported	5% - 14.9%					No
Strong		15% - 29.9%					
Not Reported		30% and Greater					
		Not Reported					

At the bottom of the dialog box are 'OK' and 'Cancel' buttons.

# Confidence Results

- Task performance is one indicator of satisfying interaction
- How can one know if people found what they were looking for?
  - Participants rated importance of attributes (Not Important - Very Important)
  - Ordered products based on this and assumption that lower attribute values are better

# Confidence Results

- For those participants who indicated a preferred product
  - found its rank in ordered list
  - considered that selection as new preference and found how many products were equal or better
- “error” too harsh? -> decision accuracy
  - Compensatory and non-compensatory strategies

# Conclusions and Future Work

- Although still many issues with sample database, performance improvements are possible over ranked list
- More care in choosing attributes, naming them, and making them accessible will also likely yield improvements
- Focus on distinguishing preferred products may simplify interface
